

Tremendous Academy

Assignment Reflection

Developing the Tremendous Academy learning resource for English Second Language learners in Grades 10–11 gave me an opportunity to consider how information and communication technology (ICT) can support teaching and learning. The resource focuses on writing skills, particularly formal and informal email writing. Its purpose is to organise learning content and provide learners with guidance, activities, assessment, feedback, and additional learning support in one accessible place.

One of the main strengths of the resource is its structured approach. The sections move from an introduction and learning objectives to learning content, teaching aids, a lesson plan, learner activities, assessment, a memorandum, learning support, digital citizenship, and sources. This organisation can help learners understand what they are expected to learn and allow them to revisit material when necessary. Digital content also gives the teacher opportunities to combine explanations with examples and practical tasks rather than relying only on spoken instruction or printed notes.

ICT can make learning more flexible and engaging, but technology alone does not guarantee learning. Learners still need clear instructions, relevant examples, opportunities to practise, and useful feedback. The teacher remains important in explaining difficult concepts, monitoring progress, and supporting learners who need additional assistance. The resource should therefore complement classroom teaching rather than replace teacher–learner interaction.

A challenge in preparing the resource is ensuring that the information is accurate, age-appropriate, easy to navigate, and suitable for the learners' language needs. Another consideration is that learners may have unequal access to devices, reliable internet connectivity, or the digital skills needed to use online materials confidently. To reduce these barriers, the resource should use a simple layout, readable text, and accessible files. Where possible, learners should also be given alternatives, such as downloadable or printed materials.

If I were to improve the resource further, I would test it with learners and a teacher, collect feedback, and revise any confusing instructions or activities. I would also include more authentic email-writing examples, interactive practice, and opportunities for learners to assess their own work against a clear checklist. The sources and any adapted materials should be checked

carefully, and the final submission should follow the institution's requirements for referencing and acknowledging the use of AI tools.

Overall, this task has strengthened my understanding that effective ICT integration begins with learning objectives, not technology itself. A digital resource is most useful when it supports meaningful practice, inclusive participation, timely feedback, and the development of learners' independent learning skills.
